Krita sketchbook extension pack
by wojtryb
Manual
Version 1.0 beta

Installing the extension:

1.Download the sketchbookExtension.zip
2.In krita open Settings->Manage Resources->Open Resource Folder.
   This is where Krita stores all your brushes, textures.
3.In folder pykrita place the sketchbookExtension.desktop file and sketchbookExtension folder.
   In this folder you can find the actual code in which you can make changes.
4.Go back to the krita resources folder. In the actions folder, place sketchbookExtension.action file.If there is no such folder, create it.
5.Enable the extension in krita. You may need to restart it, go to settings->configure Krita->python plugin manager and make a tick near the sketchbookExtension.
6.You may need to restart krita for the last time. Your actions should be visible under Tools->scripts. You can change the default shortcuts in Settings->configure krita->keyboard shortcuts, as you would normally do.

Usage:
Extension allows you to manage virtual sketchbook pages in krita. Create a new page before you start your drawing. Draw creating your pages inside the page. Once you fill the page, create a new one - everything you drew so far will be hidden. You can easily switch between pages using a docker.
All layers outside the Pages are considered a background - they won't be changed with the script. You can move existing layers inside a page and between pages manually.

Keyboard shortcuts:
New page - **ctrl+Home**
Previous - **ctrl+PgDown**
Next - **ctrl+PgUp**
